

## REMARKS

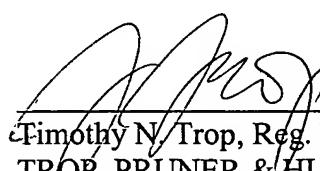

Claim 1 calls for establishing a wireless connection and “using pre-exchanged information in order to avoid the need to exchange information each time a connection is established.” In other words, the claim defines the information that is pre-exchanged to be that information that is needed to avoid the exchange of information each time a connection is established.

In the cited reference, the information that is asserted to be pre-exchanged is the synchronization packet. But, of course, this synchronization packet must be re-exchanged every time a communication is to occur.

Since the receiver could receive data from lots of different devices, it needs the synchronization packet every time in order to know who it is talking to. The synchronization packet is used to identify the device with which it is communicating. See paragraph 32 and paragraph 34. There is no way to communicate with these devices if it is not known who they are. See the cited reference at paragraph 31. Therefore, the synchronization packet does not constitute that kind of data which can be pre-exchanged to avoid exchanging it on each communication.

Therefore, reconsideration is respectfully requested.

Respectfully submitted,
